

**Amendments to the Specification:**

Please amend the specification as follows:

On page 13, please replace the paragraph that starts on line 20 with the words “The wet kinetic” and ends on page 14, line 2, with the word “friction”, with the following amended paragraph:

The wet kinetic coefficient of friction of the work surface that contacts the surface to be cleaned typically provides sufficient interfacial friction to effectively dislodge unwanted soil from the surface while not providing so much friction so as to make movement of the cleaning article against the surface too difficult. Examples of preferred binders for this purpose include nitrile rubber, ~~styrene-butadiene~~-styrene-butadiene rubber, and polyisoprene. Polyurethane tends to have less than preferred wet kinetic coefficients of friction.
